

Midburn Open Source

# Why Open Source?

- Improving code & project
- Advertising
- Recruiting
- Good karma
- Street cred
- getting in contact with local devs
- **It matches the burning man philosophy**

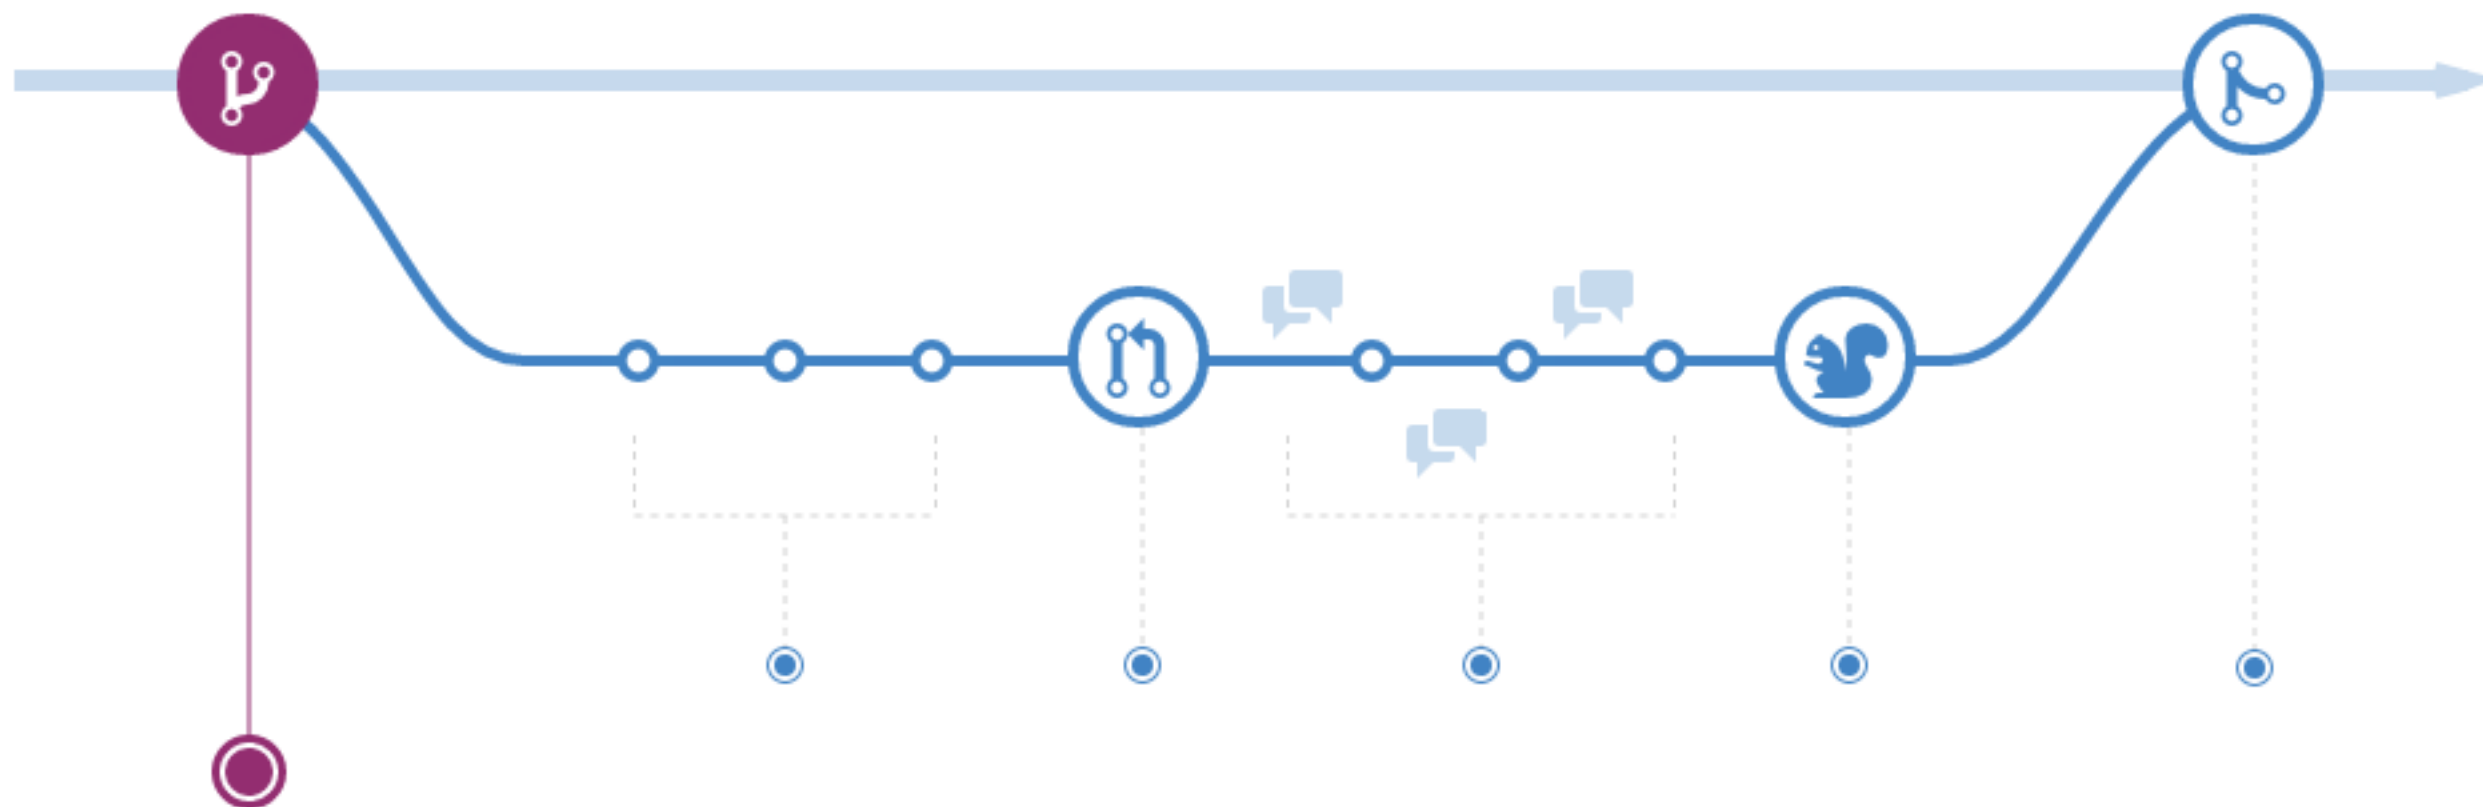

# Code

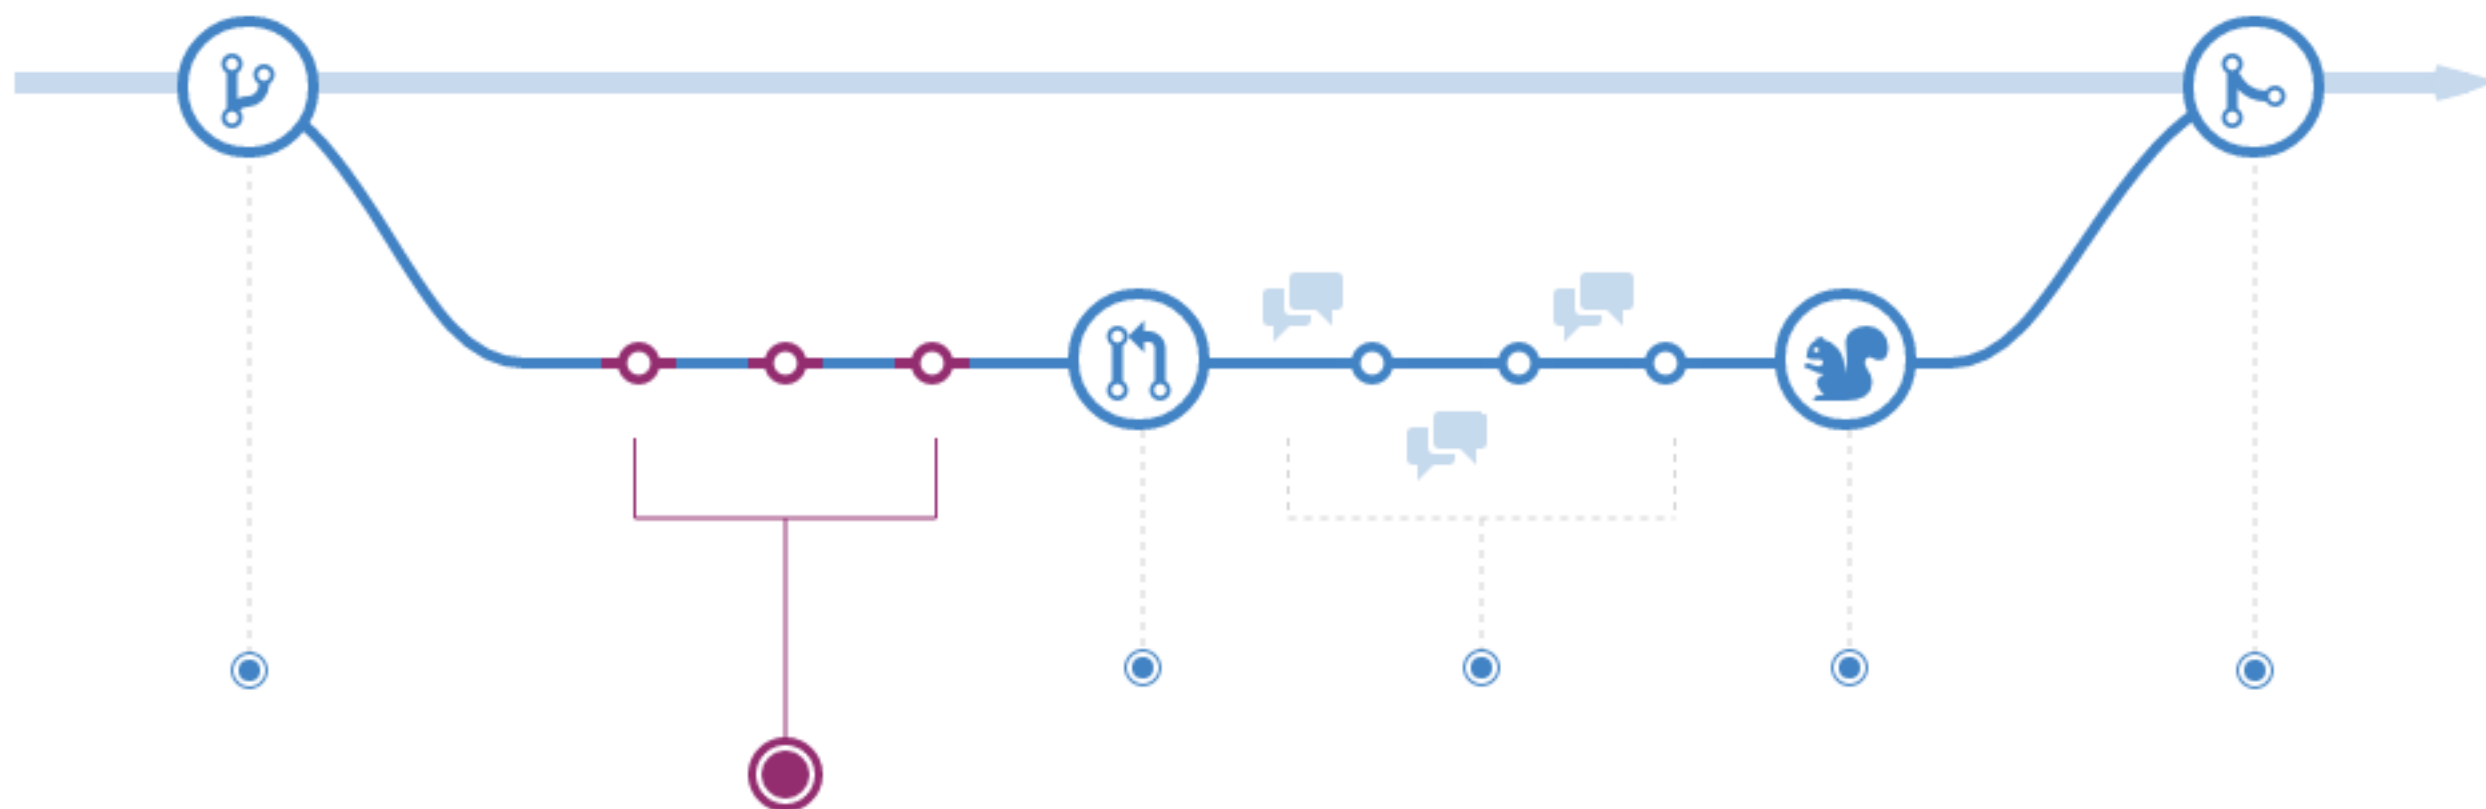

- Each project will have an owner, and main committers (only they approve pull requests)
- Core team sets the coding guidelines (Styleguide, tests, lint etc...)
- Repository templates
- CI(?)
- TDD(?)

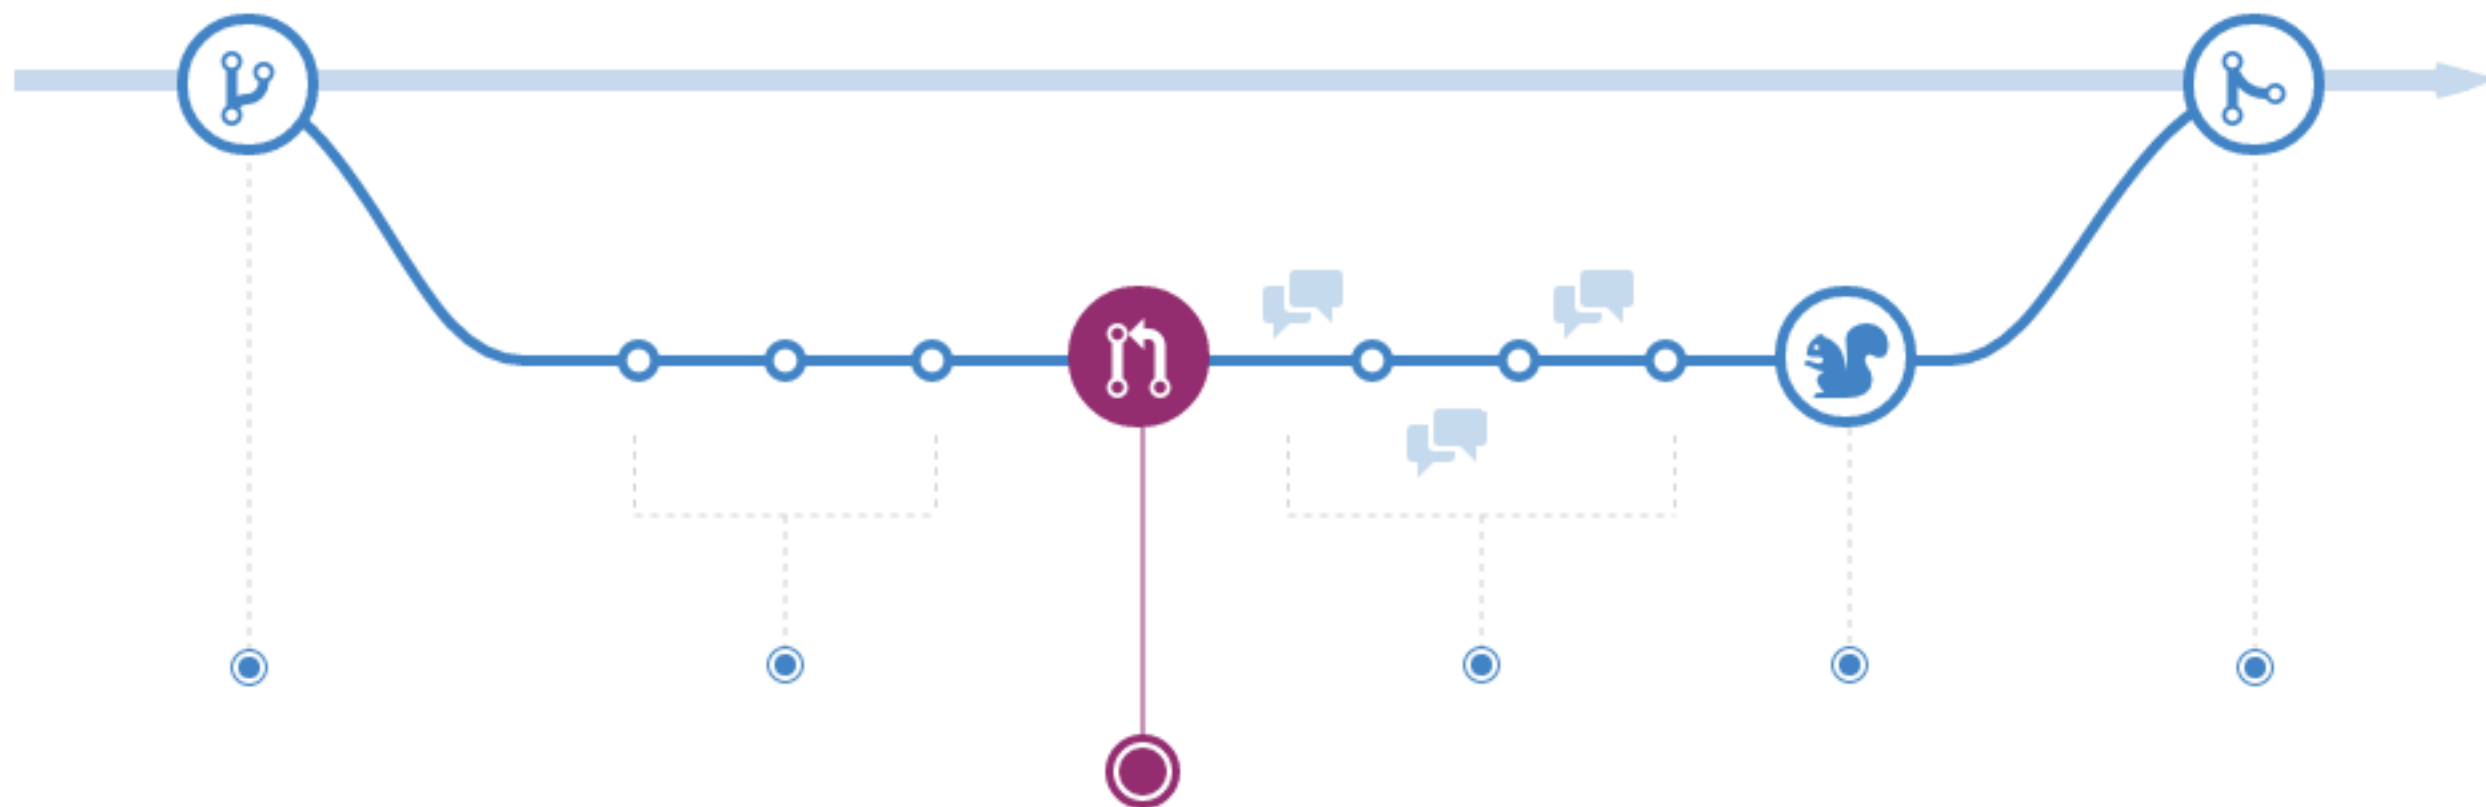

# Process

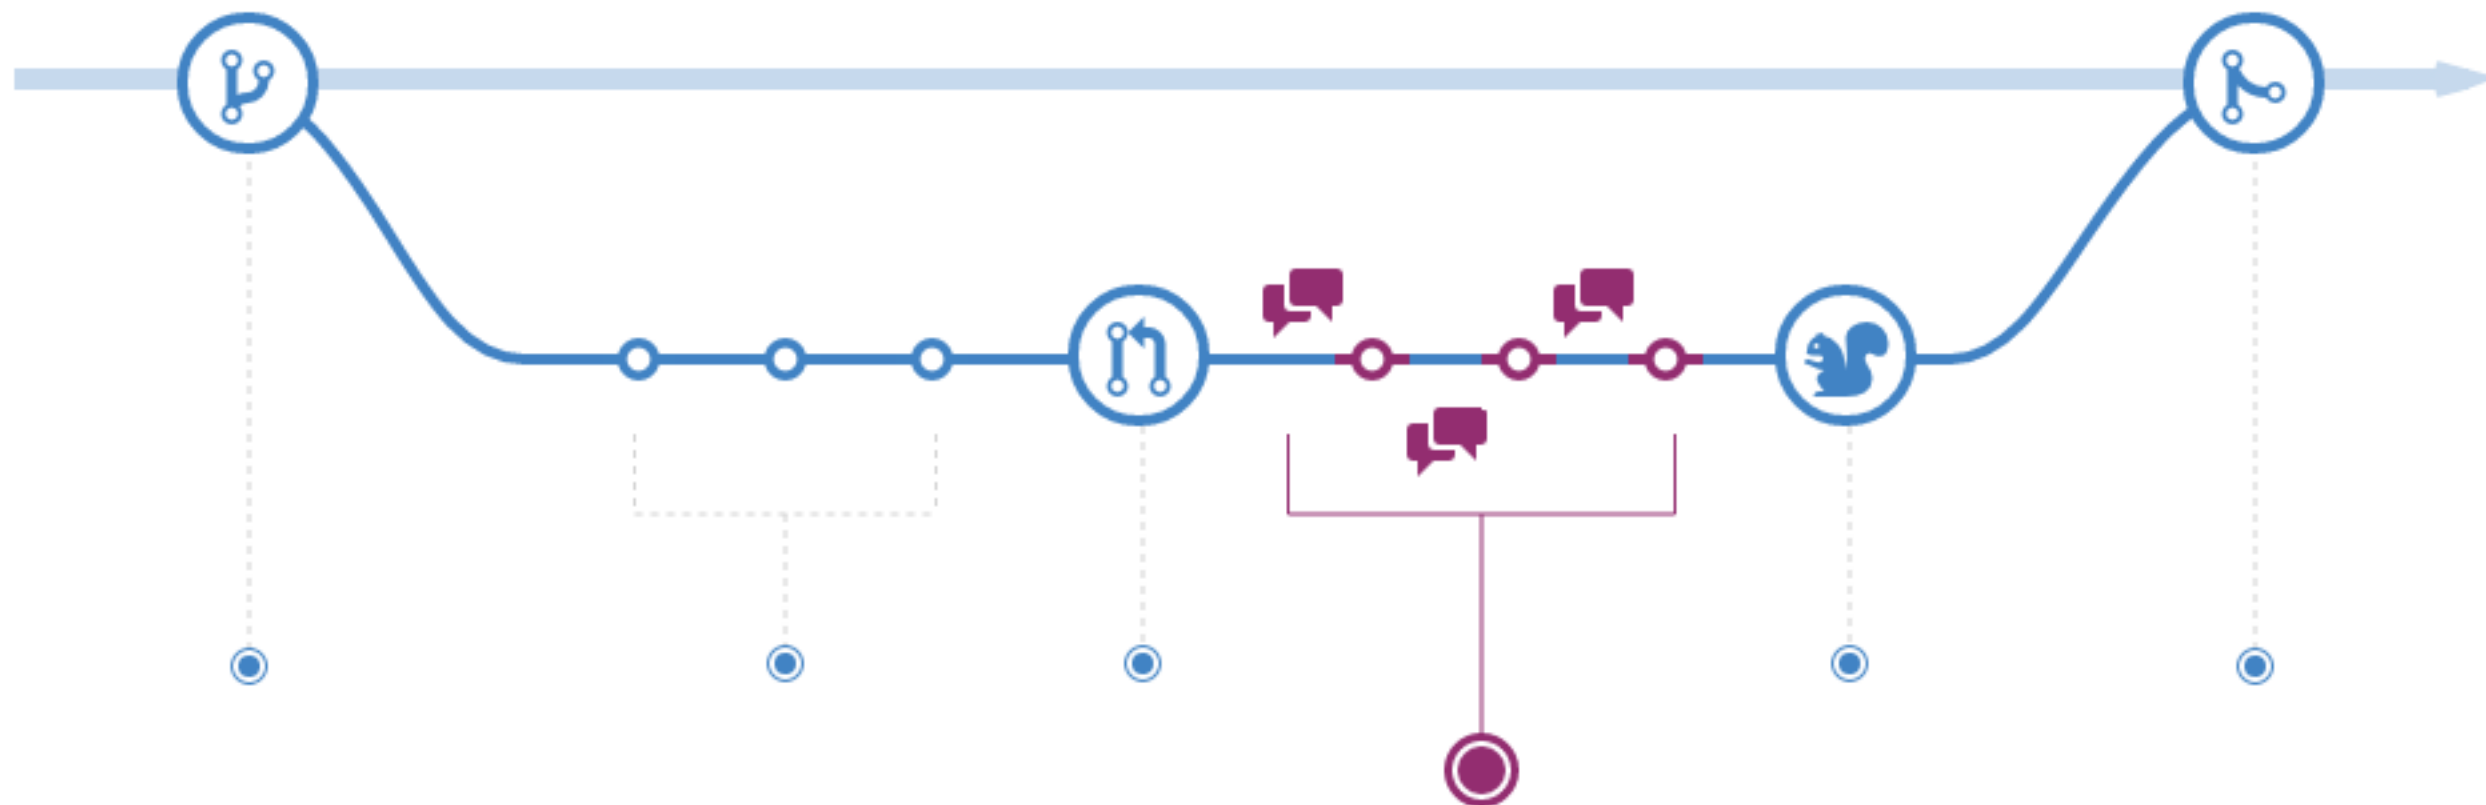

This is meant to HELP us, not be overhead. These are serious projects. If they are to be useful, and not be a nightmare to maintain, we need structure

- Github flow
- Using issues for discussion & planning
- Tests run through pull request review process (?)
- Don't be afraid to say no, but be friendly
- Starter-issues label
- @mentioning relevant people and groups

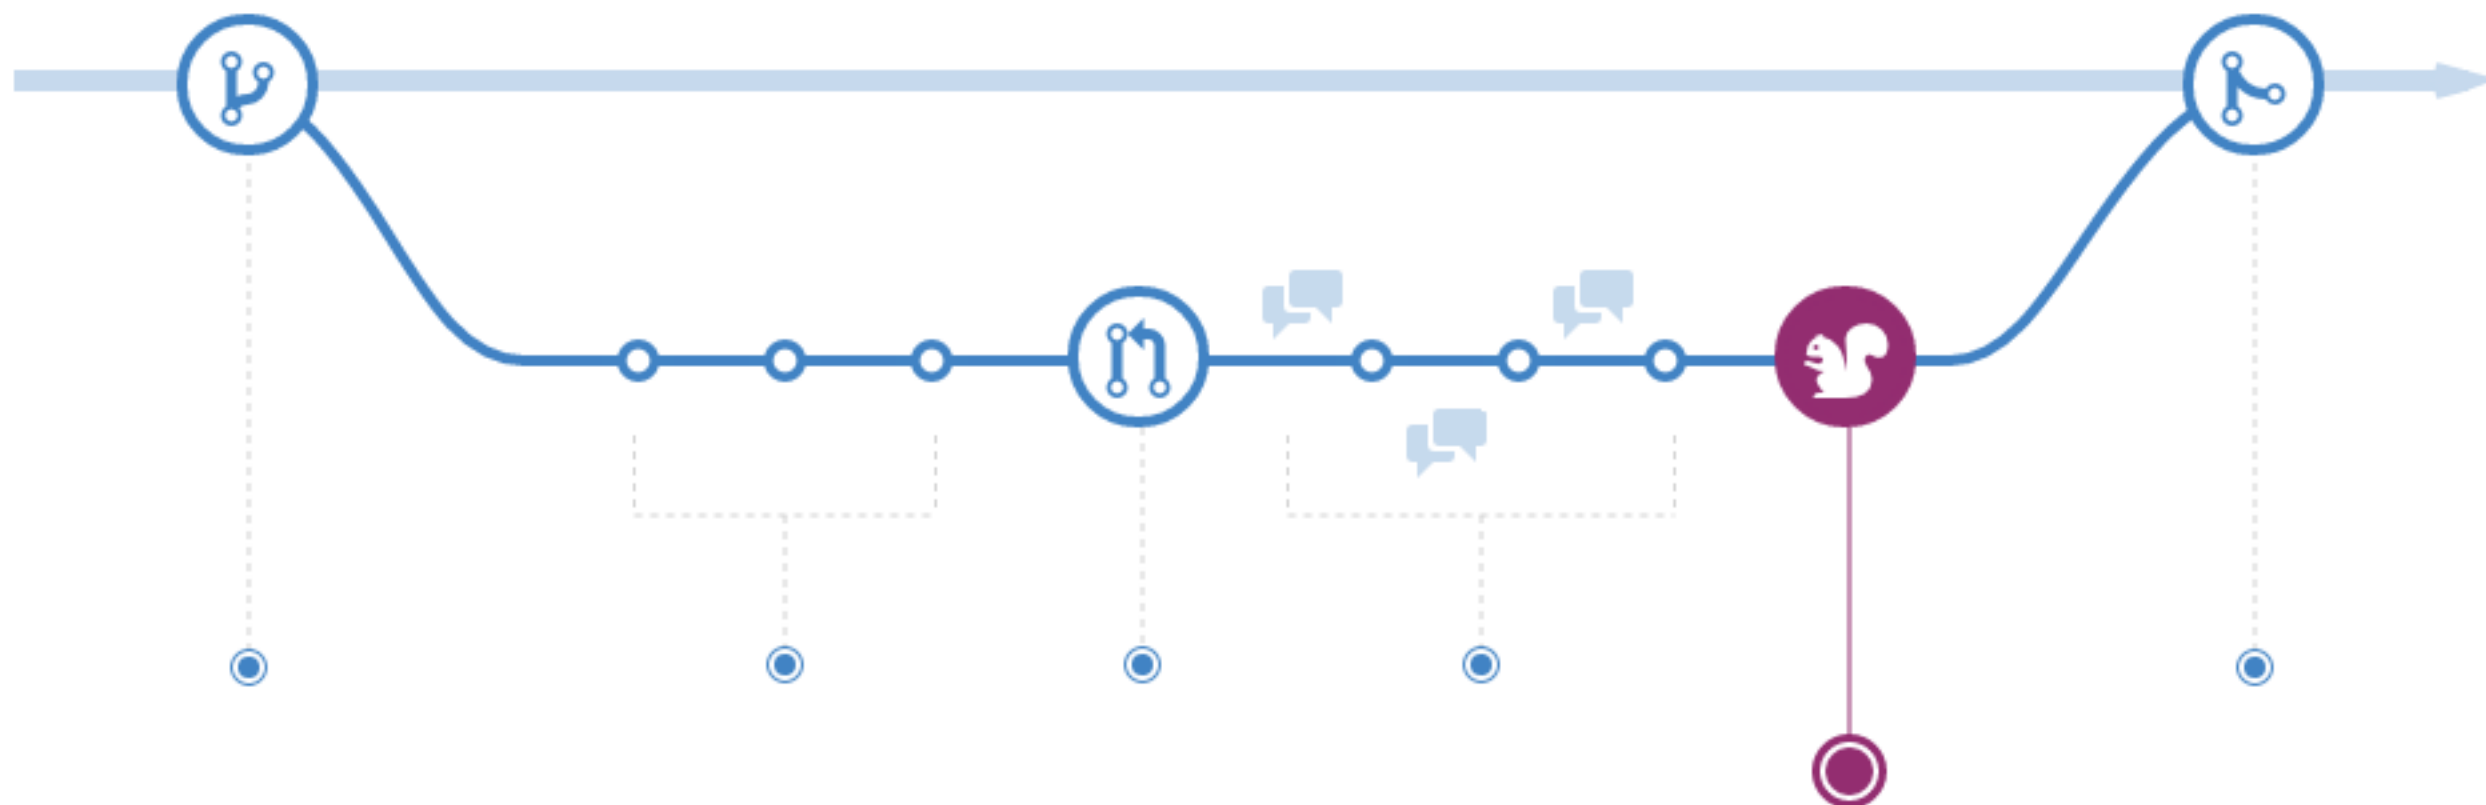

# Maintenance

- Review pull requests quickly – these people put in work
- Tend to issues (sort by least recently updated)
- Build up a community of contributors
- Slack
